

TSQL NOTES

Difference between **NULL** and **'NULL'** in TSQL

NULL	'NULL'
Indicates a <u>missing or unknown</u> value.	Indicates the <u>literal text 'NULL'</u> .
It is a special <u>SQL marker</u> .	It is a <u>string literal</u> .
Here Data does not exist.	Here Data does exist.
No actual value is stored.	Here the characters ('N', 'U', 'L', 'L') are stored.

Difference between **COUNT ()** and **COUNT (*)** in TSQL

COUNT (column_name)	COUNT (*)
It counts only the <u>NON-NULL</u> values in the given table data.	It counts <u>all rows</u> in the table regardless of NULL values.
It requires the specification of <u>column name</u> from the table. (i.e. it uses 'column_name' in its brackets)	Here it does not require the specification of column name from the table. (i.e. it uses <u>asterisk '*'</u> sign in its brackets to fetch all rows)
